

Positive Displacement Blower Silencers

Application

This combination reactive/ absorptive silencer is used typically on the intake of positive displacement blowers in applications where the blower operates above the critical PLV or when the noise level criteria of the blower is stringent.

Silencer Selection Guide

The following information will enable you to determine the appropriate silencers for your blower application.

Silencer Size

Table 1 provides the normal capacity of Silex silencers, in CFM. The sizes in Column 1 refer to the inlet sizes of silencers, in inches. Capacities are expressed in inlet CFM. Find the column which is equal to or greater than the operating pressure of your blower and then, from that column, find the value which is equal to or greater than the blower's CFM. The appropriate size is the value shown in column 1 of the table.

Calculate the back pressure of your blower using table 3 and formula at right

Table 1

		Capacity (Inlet CFM 14.7 PSI & °F)					
Size	Inlet Silencer	Discharge Silencer					
		4 PSIG	6 PSIG	8 PSIG	10 PSIG	12 PSIG	15 PSIG
1	38	39	40	41	43	44	45
1.5	85	88	91	93	96	98	101

Silencer Type

Table 2 groups Silex silencers by silencer type. Determine which models are appropriate for your application based on whether the inlet and/or discharge speeds are above or below transition speeds. If the application has a critical noise specification, use a combination reactive/absorptive model.

Table 2

Pitch Line Velocity	Inlet	Discharge
Below Transition	Class 4	Class 4
	Class 5	Class 5
		Class 6
Above Transition	Class 4	Class 4
	Class 5	Class 5
		Class 6

Pressure Drop

Table 3 sets out the pressure drop coefficients for Silex blower silencers. Use these coefficients in the equations to calculate the silencer pressure drop.

Table 3

Type	Silencer Model	Straight Thru	Side Inlet
Intake Silencers	Class 4	4.20	4.60
	Class 5	4.80	5.30
	Class 7	5.50	6.00
Discharge Silencers	Class 4	4.20	4.60
	Class 5	4.80	5.30
	Class 6	5.20	5.70
	Class 7	5.50	6.00
Absorptive Silencers	Class 4	0.20	-
	Class 5	0.75	-
	Class 6	0.80	-
	Class 7	0.85	-

Pressure Drop

The following formulas may be used to calculate pressure drop through the silencers covered in this catalog.

$$\text{Inlet } \Delta P = \left(\frac{v}{4005} \right)^2 c$$

(assumes silencer inlet is open to atmosphere)

$$\text{Discharge } \Delta P = \left(\frac{v}{4005} \right)^2 c \times \frac{P}{14.7} \times \frac{530}{T}$$

ΔP = Pressure drop through silencer, inches, H₂O

V = Air velocity through silencer, feet per minute

C = Individual Silencer restriction coefficient - empirical constant (See Table 3)

T = Discharge temperature, °R. absolute (operating temperature in degrees F + 460)

P = Discharge pressure, PSIA (operating pressure in PSIG + 14.7)
